Marked-up Pages

Figure 7. The T cell proliferation responses observed in Figures 3, 4 and 6 are confirmed by [IL-5] measurement in Figures 7(a), 7(b) and 7(c) respectively. As expected, these results show that IL-5 production correlates with T-cell proliferation.

Figure 8. Hypothetical protein and peptides (15mers) derived from overlapping by one residue.

10 Figure 9. Multiple overlapping peptides (SEQ ID NOs: 6-18) (MOP) from the cat allergen Fel d I.

The three sequences within the box were insoluble in aqueous solution and as a result were excluded from the MOP preparation for clinical use.

15 Figure 10. An example of LAR induced by the Fel d I MOP. The intradermal administration of 13 peptides which comprise MOP (solid circles; 2.5 µg, day 1) induce a fall in FEV1 of greater than 20% at 3 hours. Control day administration of 30 BU cat dander extract does not induce a fall in FEV1 (open circles). A second administration of MOP (solid triangles; 2.5 µg, day 66) results
20 in an attenuated fall in FEV1 which does not reach 20%. Arrows indicate the use of rescue medication (B2 agonists).

Figure 11. Changes in the cutaneous late phase response to whole allergen 6 hours after intradermal administration of whole cat dander extract before and
25 after intradermal administration of MOP.

Figures (a), (b) and (c) were administered intradermally to cat allergic asthmatic subjects inducing a fall in FEV1 of greater than 20% compared
